**CS151**
Final Project
Report 3

Demo of what we have gotten so far

Compared to last week, we have implemented new features:

- Export Button: this button will export all the tasks of the current "month" into a .txt file. The name of the file will be month_year.txt (the file will contain recurring events of the month only). The file locates at the same direction as the src folder.
-The days that are not related to the current month should appear in grey color (they are also clickable , showing a task frame of the relating day). When clicking on the previous or next month buttons, the data of that day is not erased, it remains the same
-The current day is red

Remaining task:

-Export Button: implemented but still need to test and apply more logic
-Buttons edge cases (exp when nothing is chosen but the user clicks Delete or Edit, these buttons should do nothing, not report error)
-The navigation can go as far as the Gregorian Calendar can make it (for now, we allow 2000-2999, we figured out that it should be 1019-2999)
-When you click on a particular date, the current view on frame 2 will change accordingly (not pop up a new frame but change the frame)
